Brief explanations

1. Create a Calculated Column for 'Category Type'

This calculated column classifies each row into a specific category based on the conditions defined in a DAX formula. It helps organize data into meaningful groups for easier analysis and visualization.

2. Calculate Revenue per Order in the Order Details Table

This calculation determines the revenue generated by each order using the relevant columns in the Order Details table. It helps analyze order-wise revenue and compare the performance of different orders.

3. Create a Calculated Column to Categorize Sales

This column classifies each order as Above Average or Below Average based on its Amount value. It helps identify orders with higher or lower sales amounts and supports sales performance analysis.

4. Total Orders Visual (Card)

The card displays the total number of orders, approximately 2K. It provides a quick overview of the overall order volume.

5. YTD Sales Visual (Card)

The card displays Year-to-Date (YTD) Sales, approximately 1M. It helps track the sales generated from the beginning of the year up to the reporting date.

And also created a data visualization on various aspects in dataset.It has a dashboard on all over dataset using DAX FORMULAS and DAX MEASURES
